Singleton−cohort event studies: each line is one state's ATT(g,t) path
20 treated−state paths shown (of 23 treated in panel; 3 lack usable data). Each gray line is an entire cohort's ATT(g,t) path estimated from n=1 state −− cross−line spread is single−state noise, not averageable treatment heterogeneity.
log(filings per 1k renters) − never−treated mean (re−centered to 0 at t = −1)
