Null−DGP distribution of ATT estimates vs. claimed confidence bands
State panel: n = 20 null simulations. County panel: n = 50 null simulations.
Grey = boxplot + jittered draws; vermillion band = claimed mean(ATT) +/− 1.96 x mean(SE).
Where the band is much narrower than the point spread, the estimator over−rejects; where much wider, it over−covers.

Null ATT draw (log points; true effect = 0, dashed line)
Type I error labels are recomputed directly from sim_results.csv (share of p < 0.05 among converged draws).
